ROASTERY OS — HOW IT WORKS, IN PLAIN WORDS

WHAT THIS THING IS — IN PLAIN WORDS

(The demo you clicked around in is a pretend version — like a model of a house before it's built. Nothing in it is real yet. But everything it does, the real one will do.)

The one-sentence version

Customers order. The computer writes your roast list. You roast what the list says. That's it.

The cookie jar rule (why you'll never oversell again)

Picture a cookie jar with 240 cookies. Every time someone buys one, the jar counts down: 239, 238, 237...

When the jar hits **zero**, the "buy" button turns off. Instantly. By itself.

Nobody can buy a cookie that isn't there — the computer physically won't let it happen. Not "usually won't." **Can't.** So when 800 people rush your drop at 9:00am, you sell every single bag and not one bag more.

The waitlist waves (no more stampede)

Instead of announcing to everyone at once, the system texts your waitlist in groups:

- 9:00am — first 200 people get the link
- 9:20am — next 200
- 9:40am — everyone else

And there's a **2-bag limit per person**, so the fast people can't clean you out and nobody gets scalped.

The sheet (your new morning)

Every night, the computer adds up every bag people ordered. Then it does one piece of math:

236 bags ordered ÷ 21 bags per roast = 12 roasts

And it writes your list for the day: "Roast #1: Camacho. Roast #2: Camacho..." You come in, look at the sheet, roast what it says, tap **Done** after each one. No adding things up in your head. No guessing. No Sharpie.

The labels (why the date is already printed)

Because the sheet decides **ahead of time** which day each coffee gets roasted, every label can be printed early — with the right roast date already on it. A thousand bags, zero hand-writing.

The inbox helper

When customers text or email — "where's my order?", "I moved, new address!" — the computer writes a reply that sounds like you. You read it and tap **Yes, send** (or fix a word first). If someone changed their address, the shipping label fixes itself too. What used to eat two hours takes about four minutes.

The two screens

- **The Storefront** — what your customers see. The shop.
- **Drop Control** — what you see. The sheet, the drop, the labels, the inbox.

They share one brain. When a customer buys a bag, your sheet already knows.

You roast. The system does everything else.
